

Capstone Sanitization Review

Purpose

This review verifies that the final capstone repository and submission evidence do not expose secrets, private credentials, personal information, or machine-specific sensitive data.

Checks Performed

Secret-pattern scan

The repository was scanned for common credential patterns, including:

- OpenRouter API keys;
- Anthropic API keys;
- Slack bot tokens;
- Google API keys;
- private-key blocks;
- suspicious hard-coded OPENROUTER_API_KEY assignments.

The only match was a test regex in `eval/test_policy.py` used to detect Anthropic-style key patterns. No actual secret value was found.

Personal and local-data scan

The repository was scanned for:

- local Windows user paths;
- the local project path;
- personal names;
- personal email addresses;
- `credentials.json`;
- `token.json`.

No personal name, personal email address, or machine-specific Windows path was found.

References to `credentials.json` and `token.json` occur only in documentation describing OAuth setup and safe credential handling.

Sensitive-file scan

The repository was checked for actual sensitive files matching names or extensions such as:

- `credentials.json`;
- `token.json`;
- `.env`;
- `.pem`;
- `.key`;
- `id_rsa`;
- `id_ed25519`.

No matching sensitive file was found.

Runtime evidence review

Final workflow evidence under `logs/` was reviewed for secret exposure. The logs contain workflow, audit, retrieval, storage, evaluation, and governance evidence rather than API credential values.

Sanitization Result

No actual API key, OAuth credential file, private key, personal email address, personal name, or machine-specific sensitive path was found in the reviewed repository content.

The capstone uses environment variables for runtime credentials and does not intentionally persist secret values in committed artifacts.

Submission Guidance

Before final submission:

- do not add local `.env`, OAuth token, or credential files;

- do not expose API keys in screenshots or the walkthrough video;
- do not display environment-variable values during recording;
- keep final PDFs limited to sanitized project evidence;
- preserve placeholder credential examples rather than real values.

Final Status

Sanitization review: PASS

The repository is suitable for final packaging based on the completed repository scans and reviewed runtime evidence.
